Sunny days between cubes

Setayesh ganji

Choreography, performing, transmedia and Exhibition design, in Collaboration with **Sapienza University of Rome**

February 2023

Choreography and the ways to approach it have been changing in history, its functions also have varied, but nowadays we know that with the knowledge of scoring and translating the actions and to be more precise movements, we can create and reproduce another forms of art using the scores, like what have happened in this project, starting from communications to get into simple shapes and creating videos based on our scores, using them to transfer meanings and also apply them to ongoing exhibition, located in the center of one of the most important and oldest universities of Europe, **Sapienza University of Rome**

First step

The data analysing process

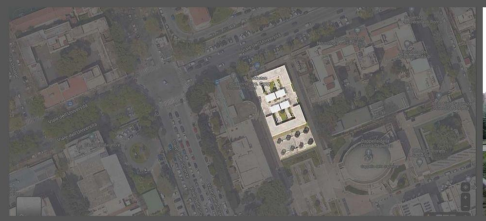

Site Study

Observing the situation, architecture, movements and communication between human in different hours of the day we've chosen the resting place located in the north western part of Sapienza's main campus.

Selected area

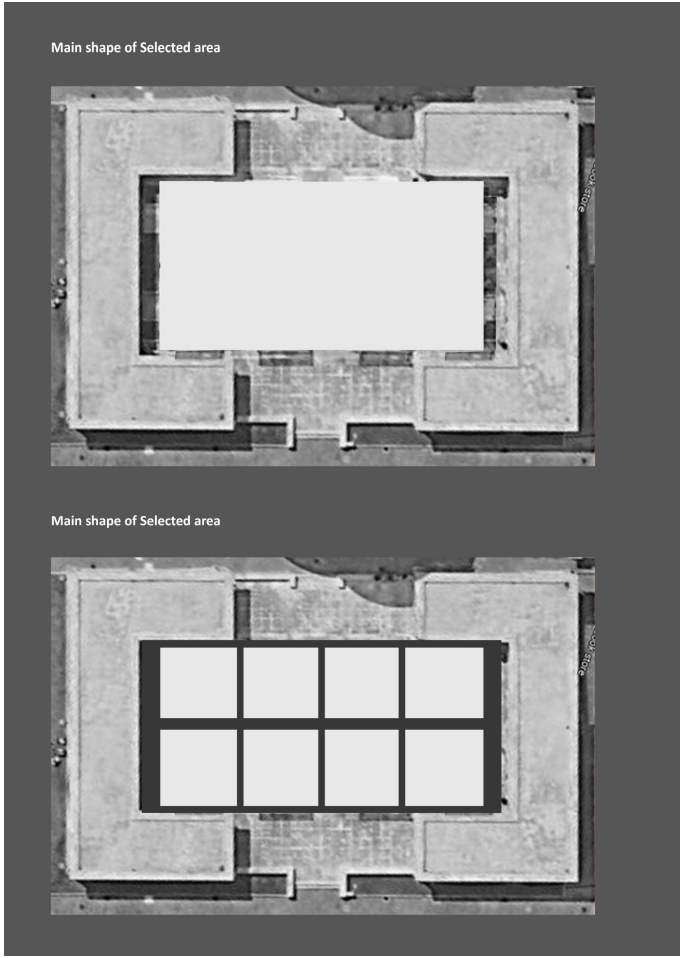

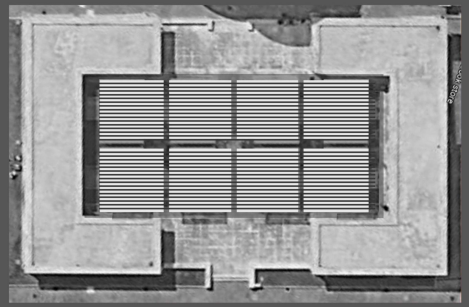

Site Study

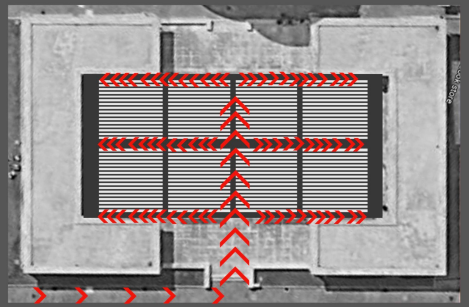

Where there are 8 big tables with 2 benches in each side, with a ceiling combined with too many rods which are in striped shapes, that produce shadows in different houses of the day, and create a perfect place for juveniles to study, have chitchats with their friends, rest, eat, read, write and do all different activities based on what they wish to do.

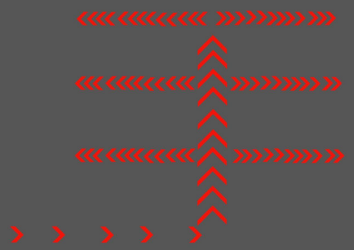

Main shape of Selected area

Direction of movement in Selected area

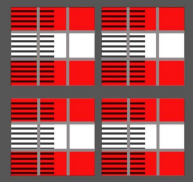

Direction of movement in Selected area

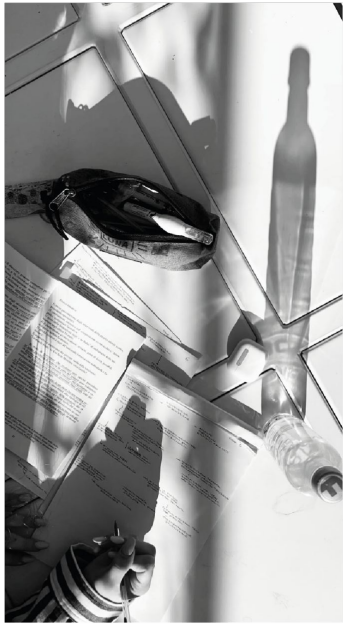

Visual exploration of the location

Selected angel for recording the actions

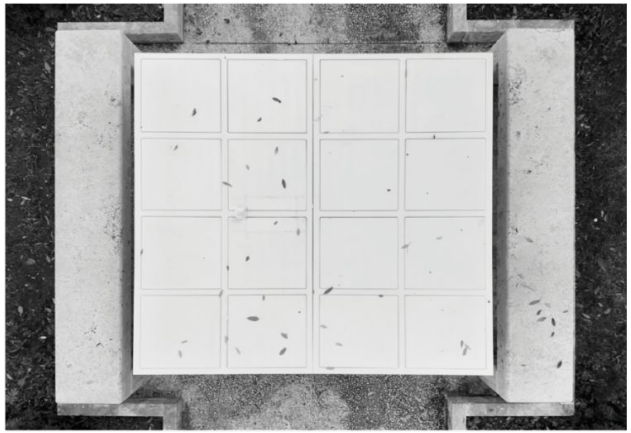

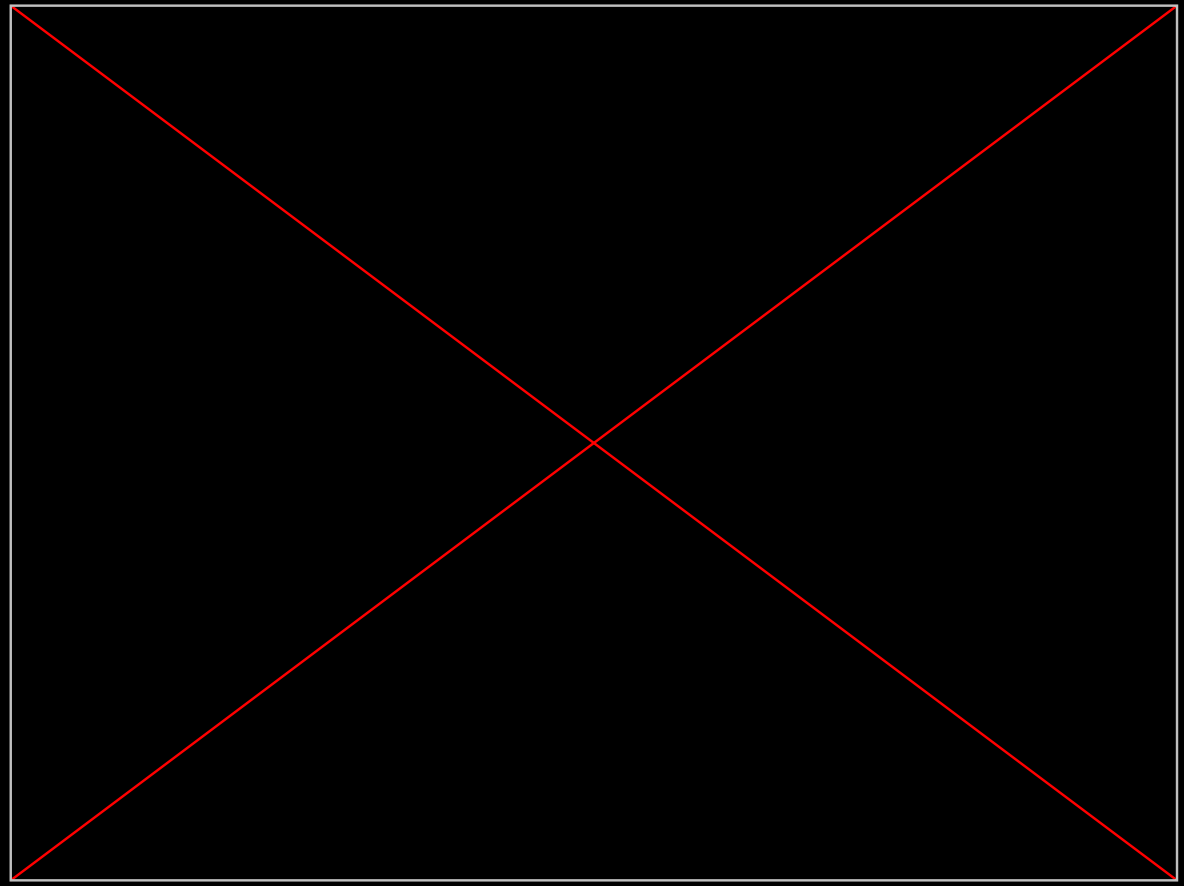

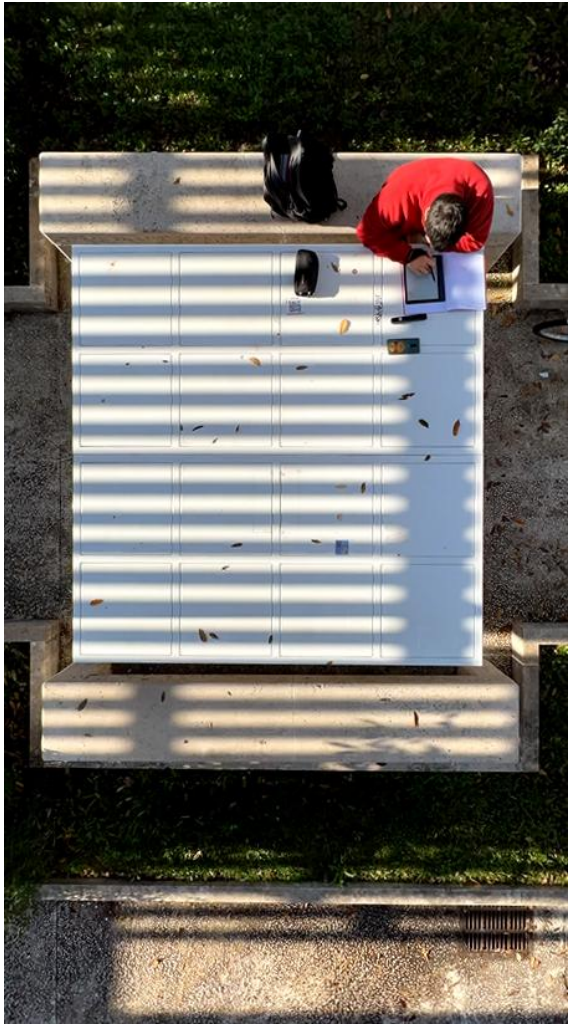

Main recorded footage

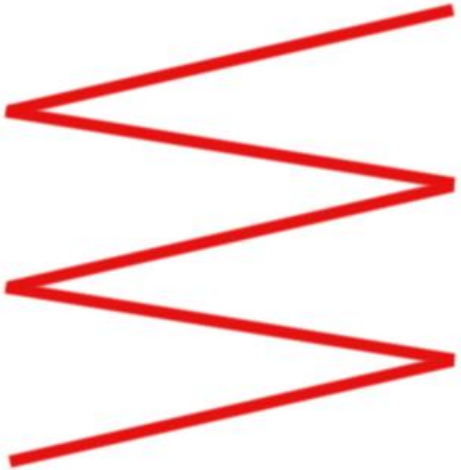

The objectification Process

In the first phase, we've chosen a red shirt boy who was sitting alone on the complete left corner of the table in midday, the only action he was busy with was writing, observing precisely this movement, his hands were going up and down, up and down repeatedly, so we have scored it with not parallel lines but zigzag ones, that represents definitely the action of writing and the movement of hands. and what was produced as the output from this score, was actually the same lines that they can move freely in the space.

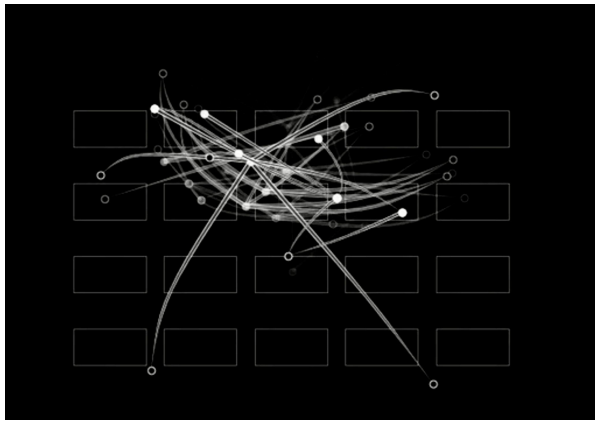

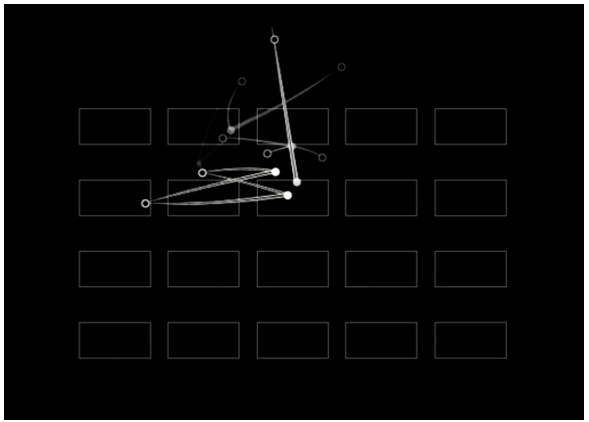

Scoring

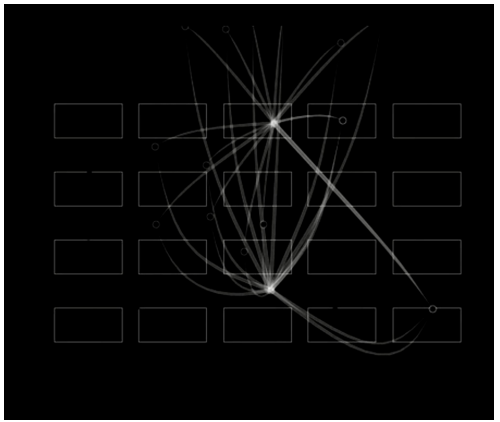

What was inspiring me a lot, while translating the scores into the Video, was William Forsythe's explanations about lines, and using them in movements, in which he also mentions that approaching a line with a spiral brings the question of avoidance, and in avoidance you establish a line in space and then you avoid the line you move around that you've established, you can move underneath it, or over the line, so it's also meaningful to Not always symmetrical or in the same equal ways, and you can produce complicated torsions and complicated movements and relationships thus.

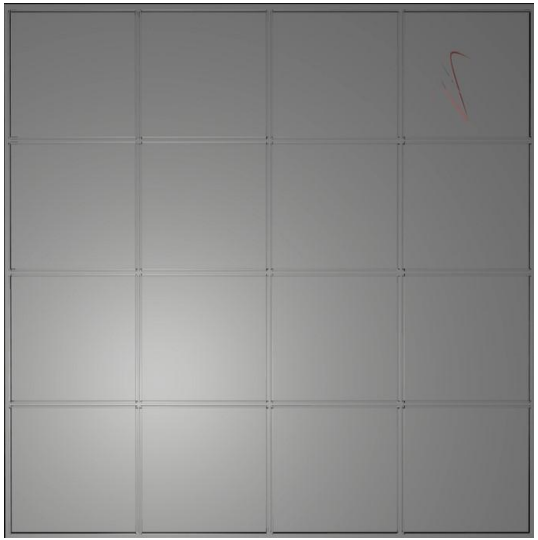

Another big inspiration for us to create this artifact was **The Cue Visualizers** in **SYNCHRONOUS OBJECTS** project**,** came about as a way to illustrate the cues over time and to allow the user to compress, overlap, and examine the relationships between cues.

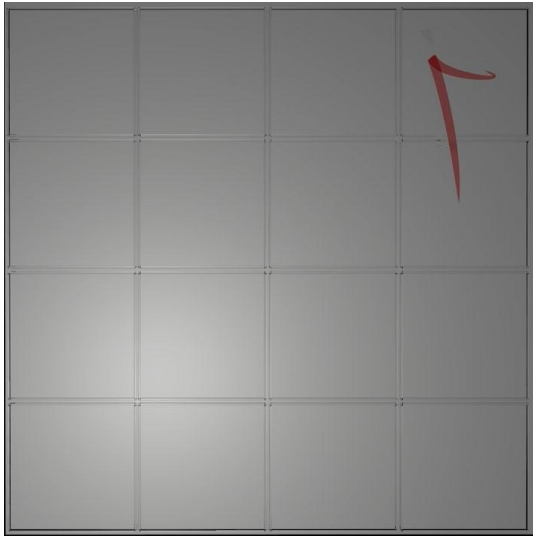

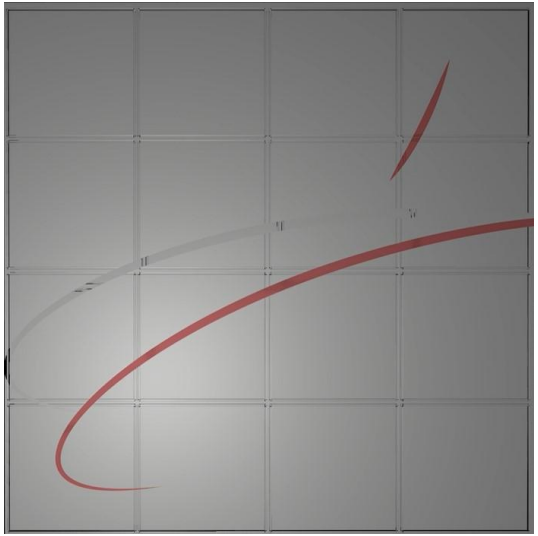

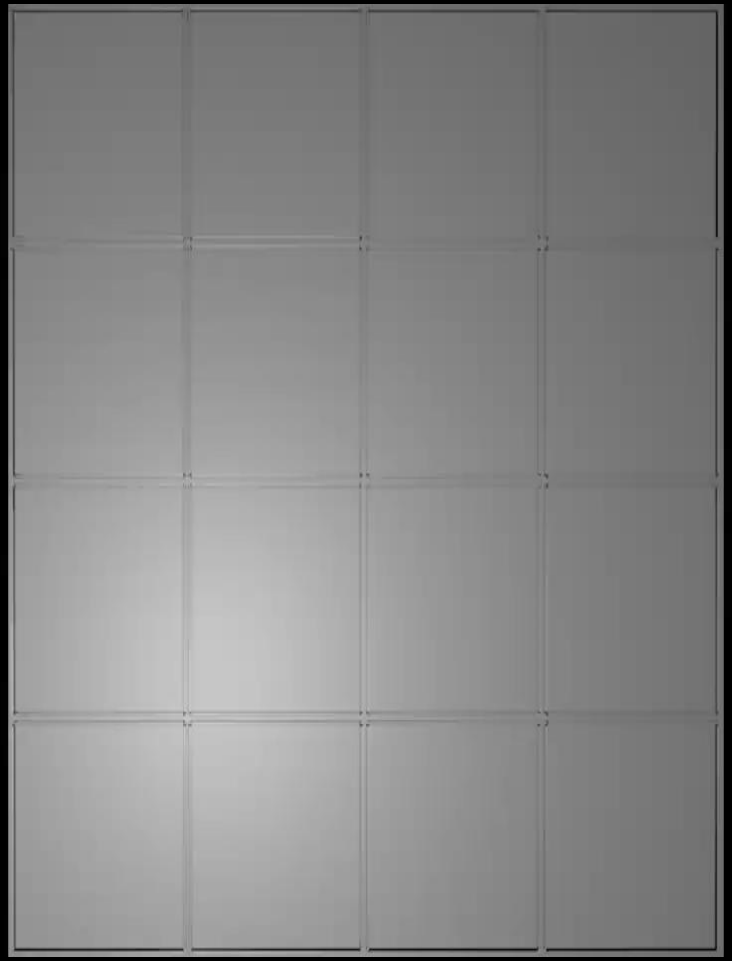

The
outcome

In the second phase,

We’ve chosen a gray shirt, boy who was sitting alone on the complete right corner of the table around 1:30 pm, and he was typing all the time, we’ve scored it into small shapes of squares which represents the shape of keyboards.

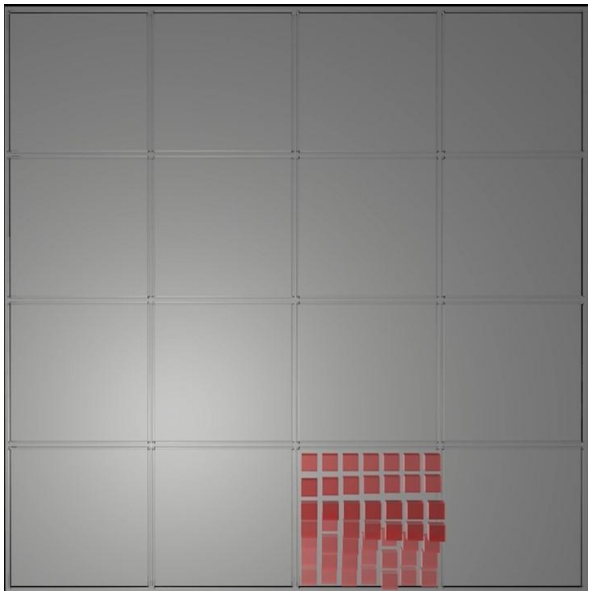

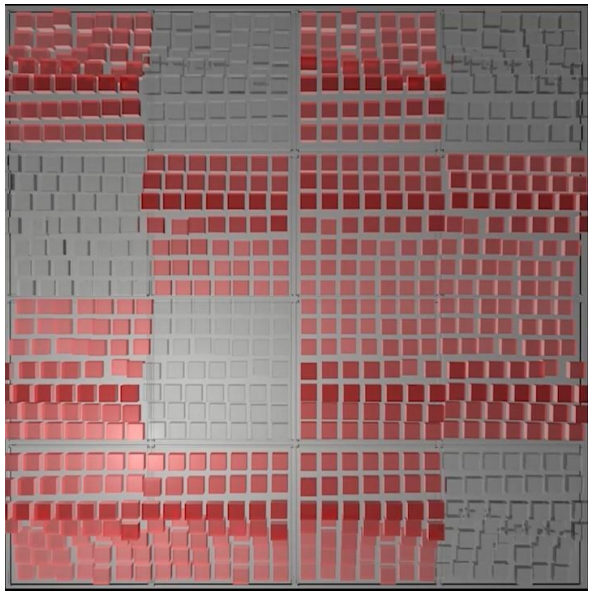

Scoring

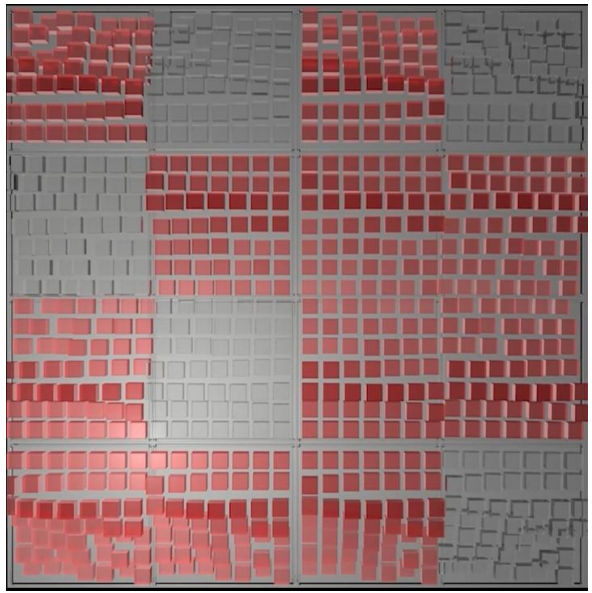

Regarding to William Forsythe's explanations about room writing, "If we analyze a simple room and its architecture, we come to its geometric context. For example, A door knob is a circle for him, so we can take that door knob and in 1 second, knock it off" so, in this way, make a movement, It's a transformative operation in which we've decided to use it to transform the keyboards into a simple shape like squares.

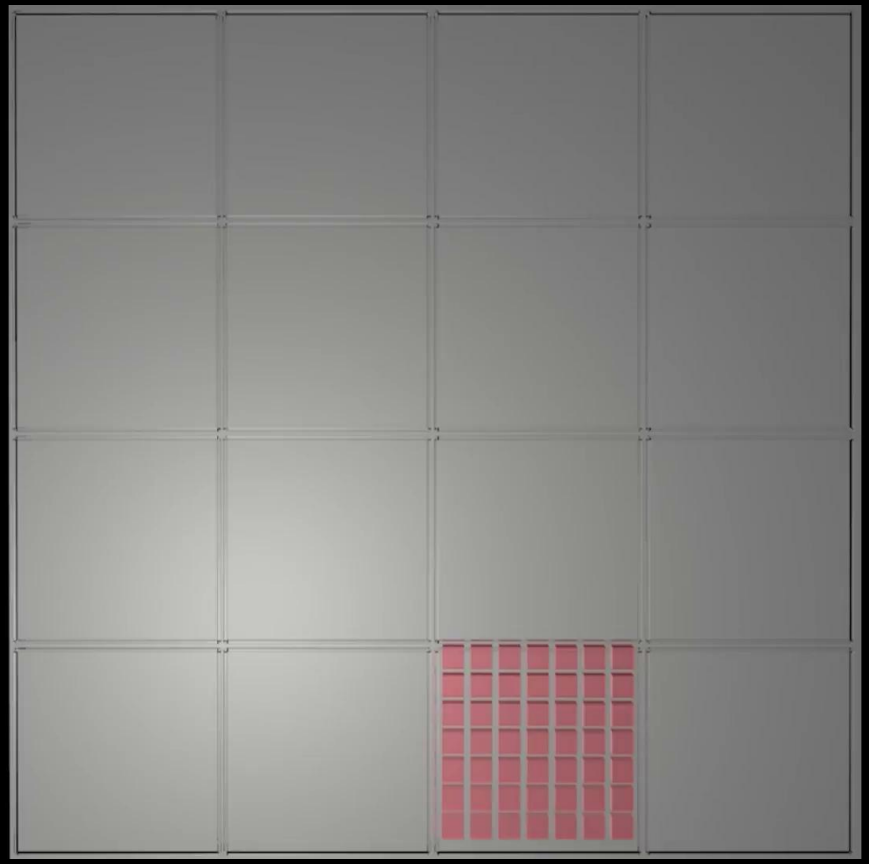

The outcome

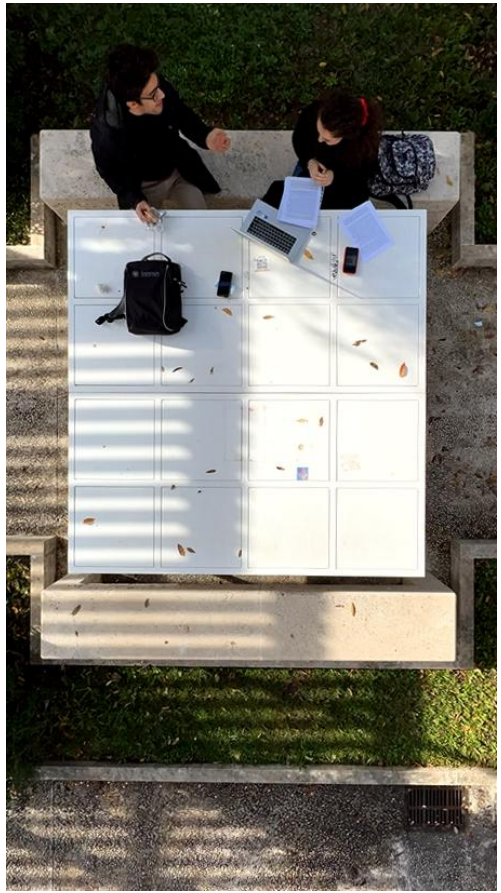

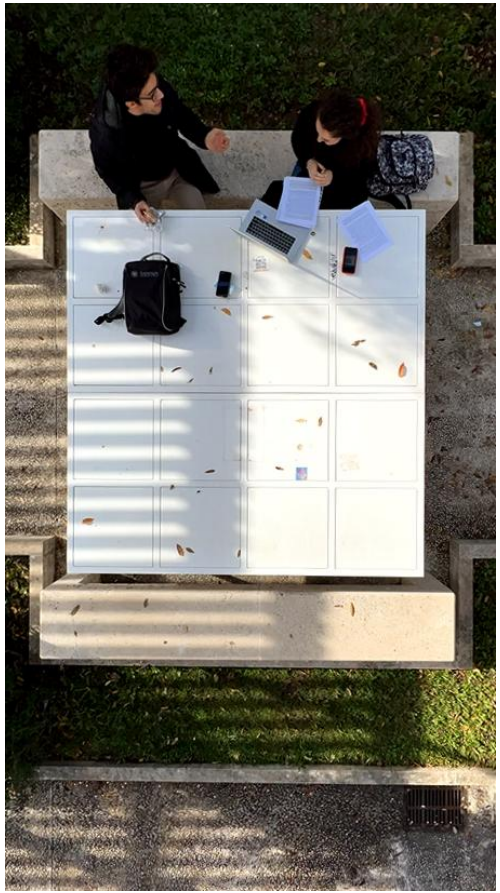

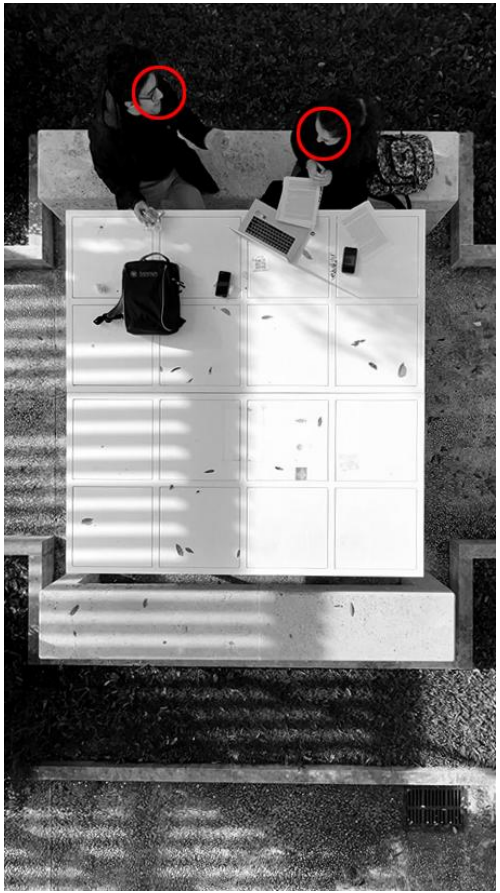

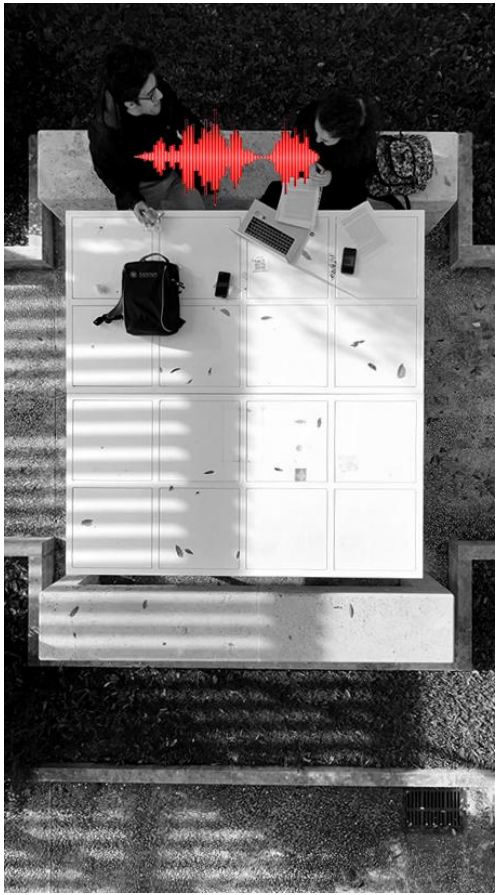

In the third phase,

We’ve chosen one boy and girl who were speaking continuously, we’ve scored and translated this action into circles and also the wave in which the sound produces.

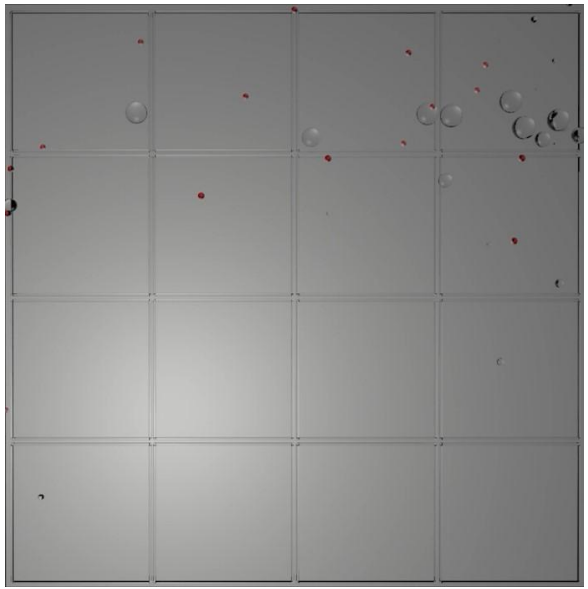

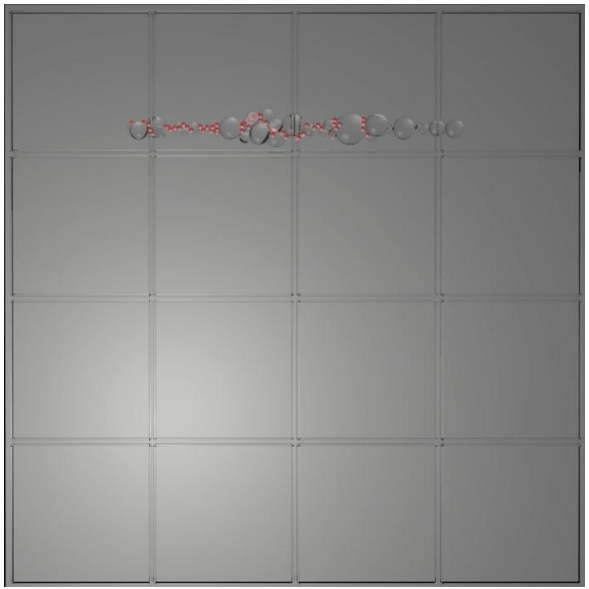

Scoring

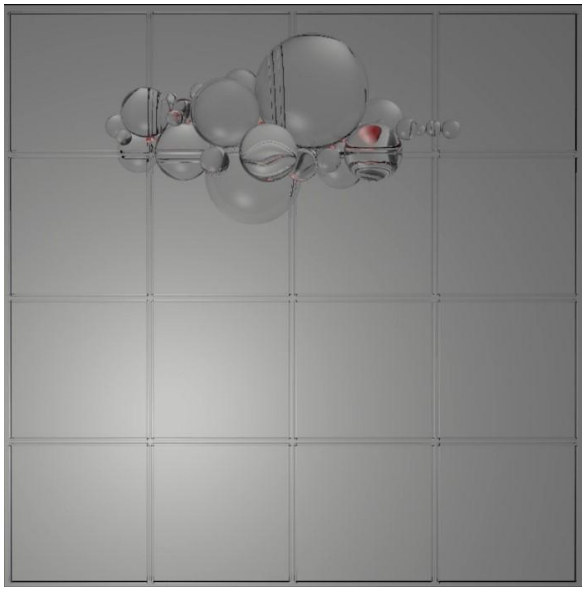

And based on William Forsythe's saying, "Dances, however, that have changed the way that we can conceive of ballet, that can also mix speech, video, sound, light and movement in flamboyant conflagrations, evoke a Balanchinian heritage that witty virtuosity, and proffer purely abstract worlds of gorgeous, endlessly inventive shape and form." So, it was relatable for me to use these waves, representing the concept of daily conversations.

The outcome

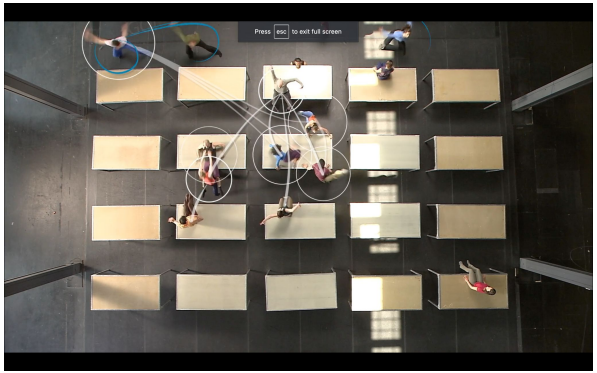

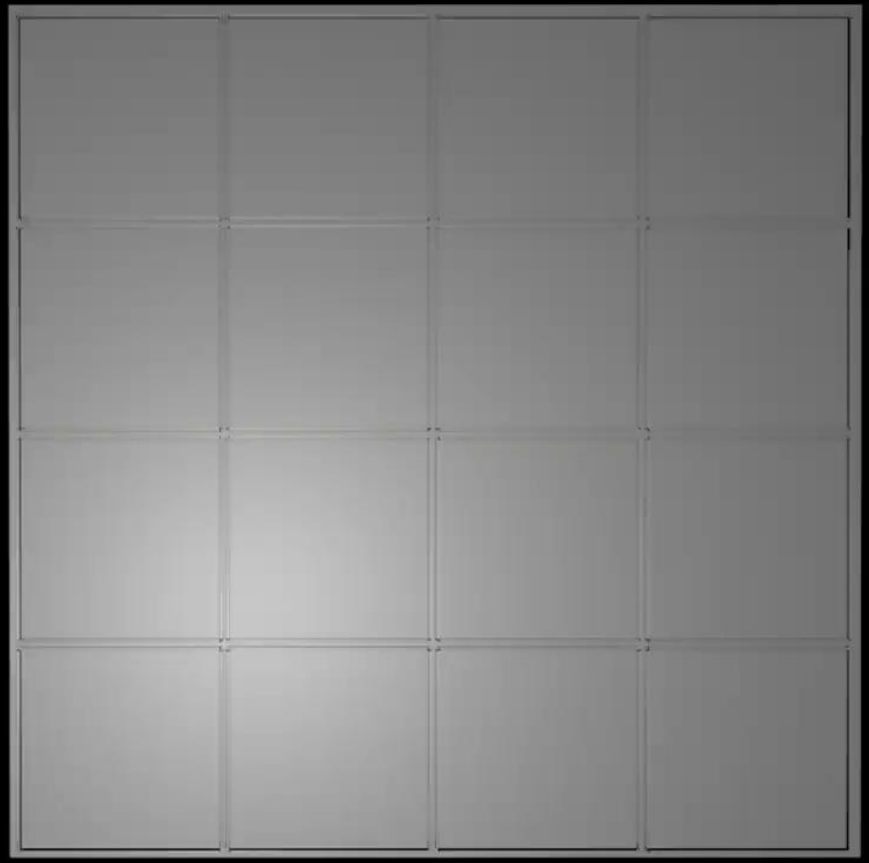

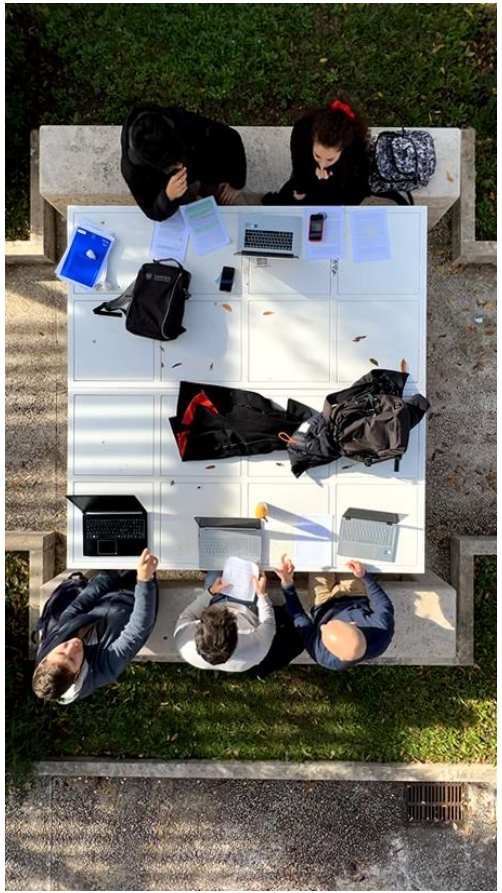

For using the shape of circle, **Cue Annotations** inspired me a lot.In this object, you can watch the cueing system of the dance unfold in a rapidly shifting network of relationships. Time is organized as dancers give and receive cues, collectively determining the flow of the dance.

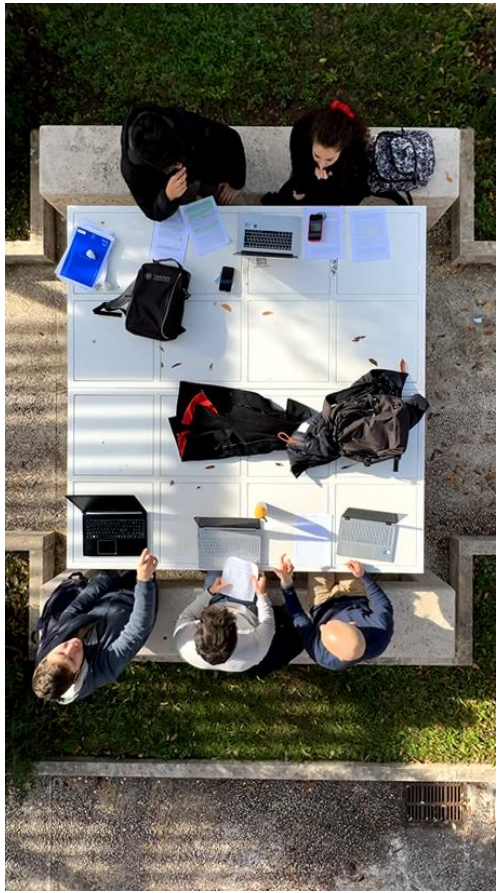

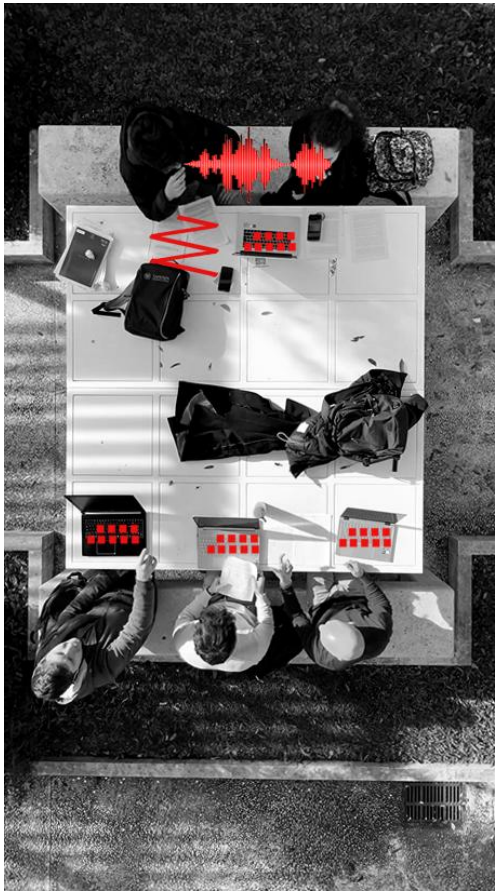

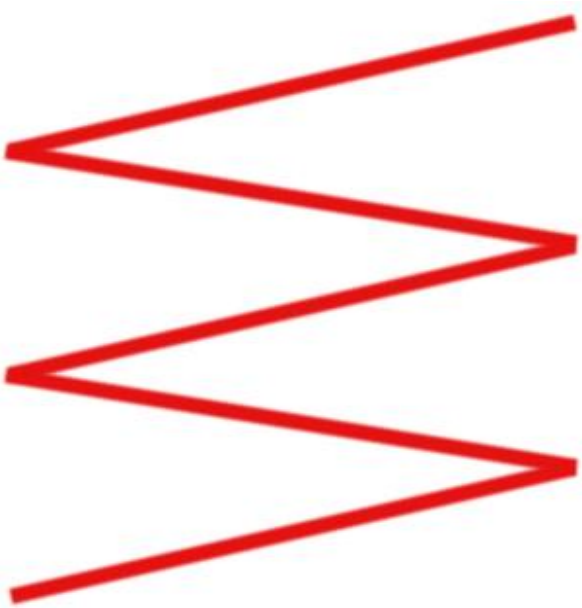

And **finally in the fourth and last phase**, I’ve chosen a group of people who were doing all the actions together, speaking, wiring, and typing at the same time, so, the final video is the combination of all these activities and transformations.

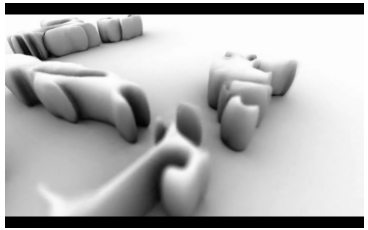

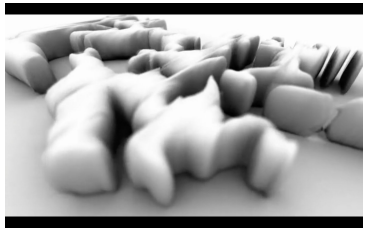

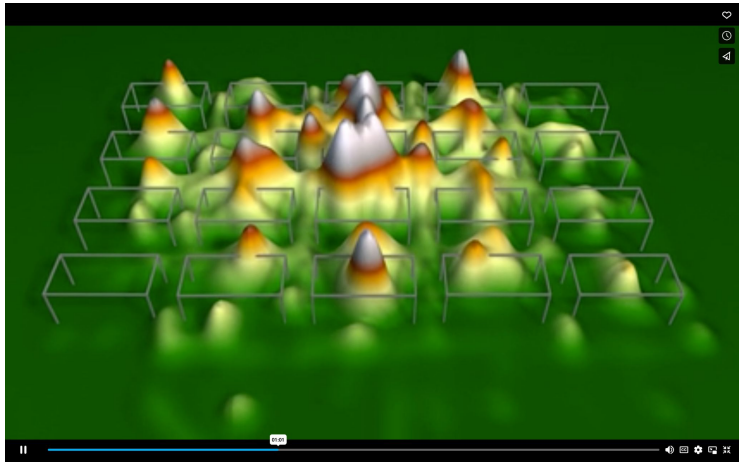

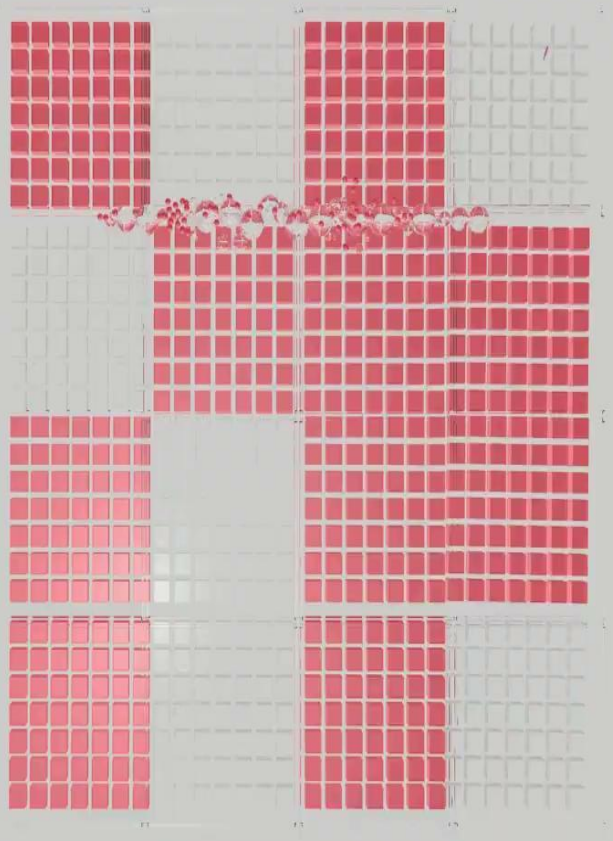

What was inspiring me a lot to create these 3d like movements and spaces was **Motion Volumes,** in **SYNCHRONOUS OBJECTS** project, which In this object, the outer edges of the dancers' motions in *One Flat Thing, reproduced* are transformed into volumes that emerge and dissolve in space.

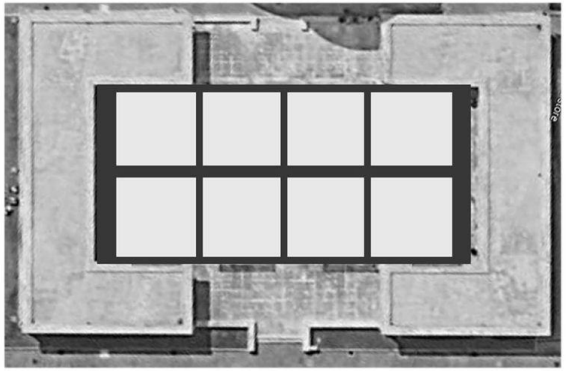

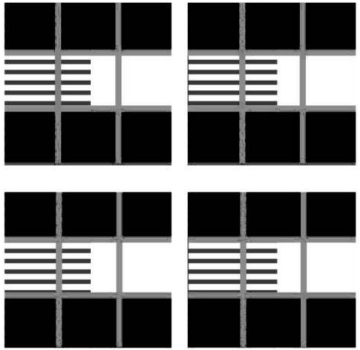

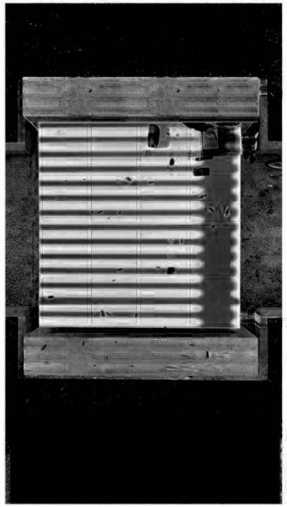

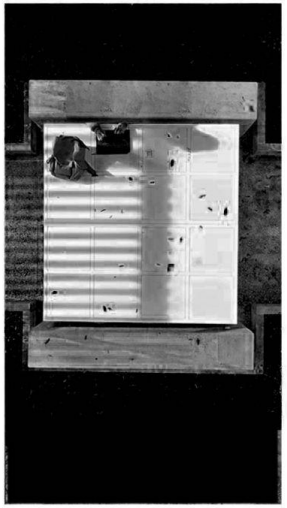

The
Transmedia process

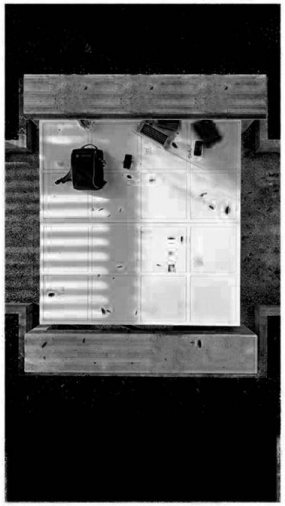

Exhibition Design

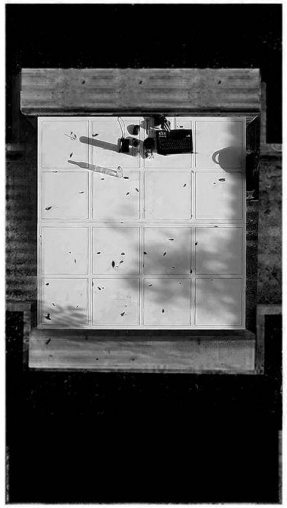

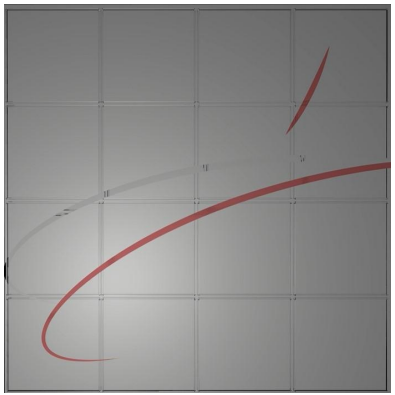

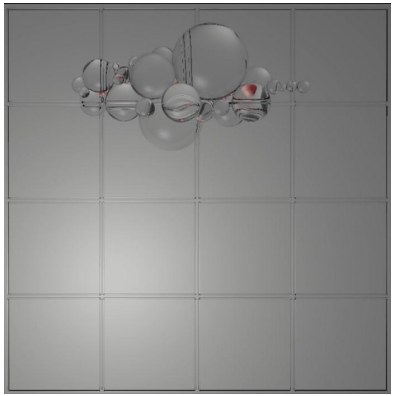

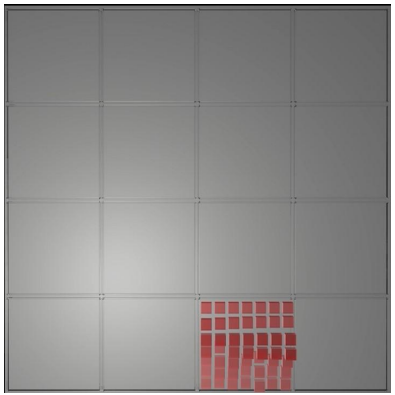

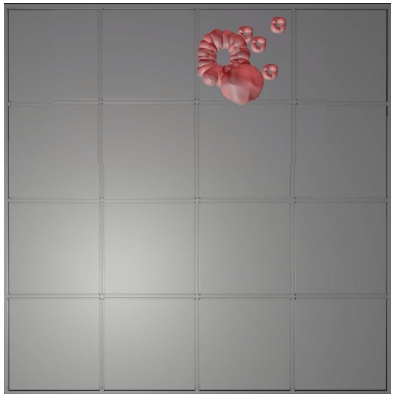

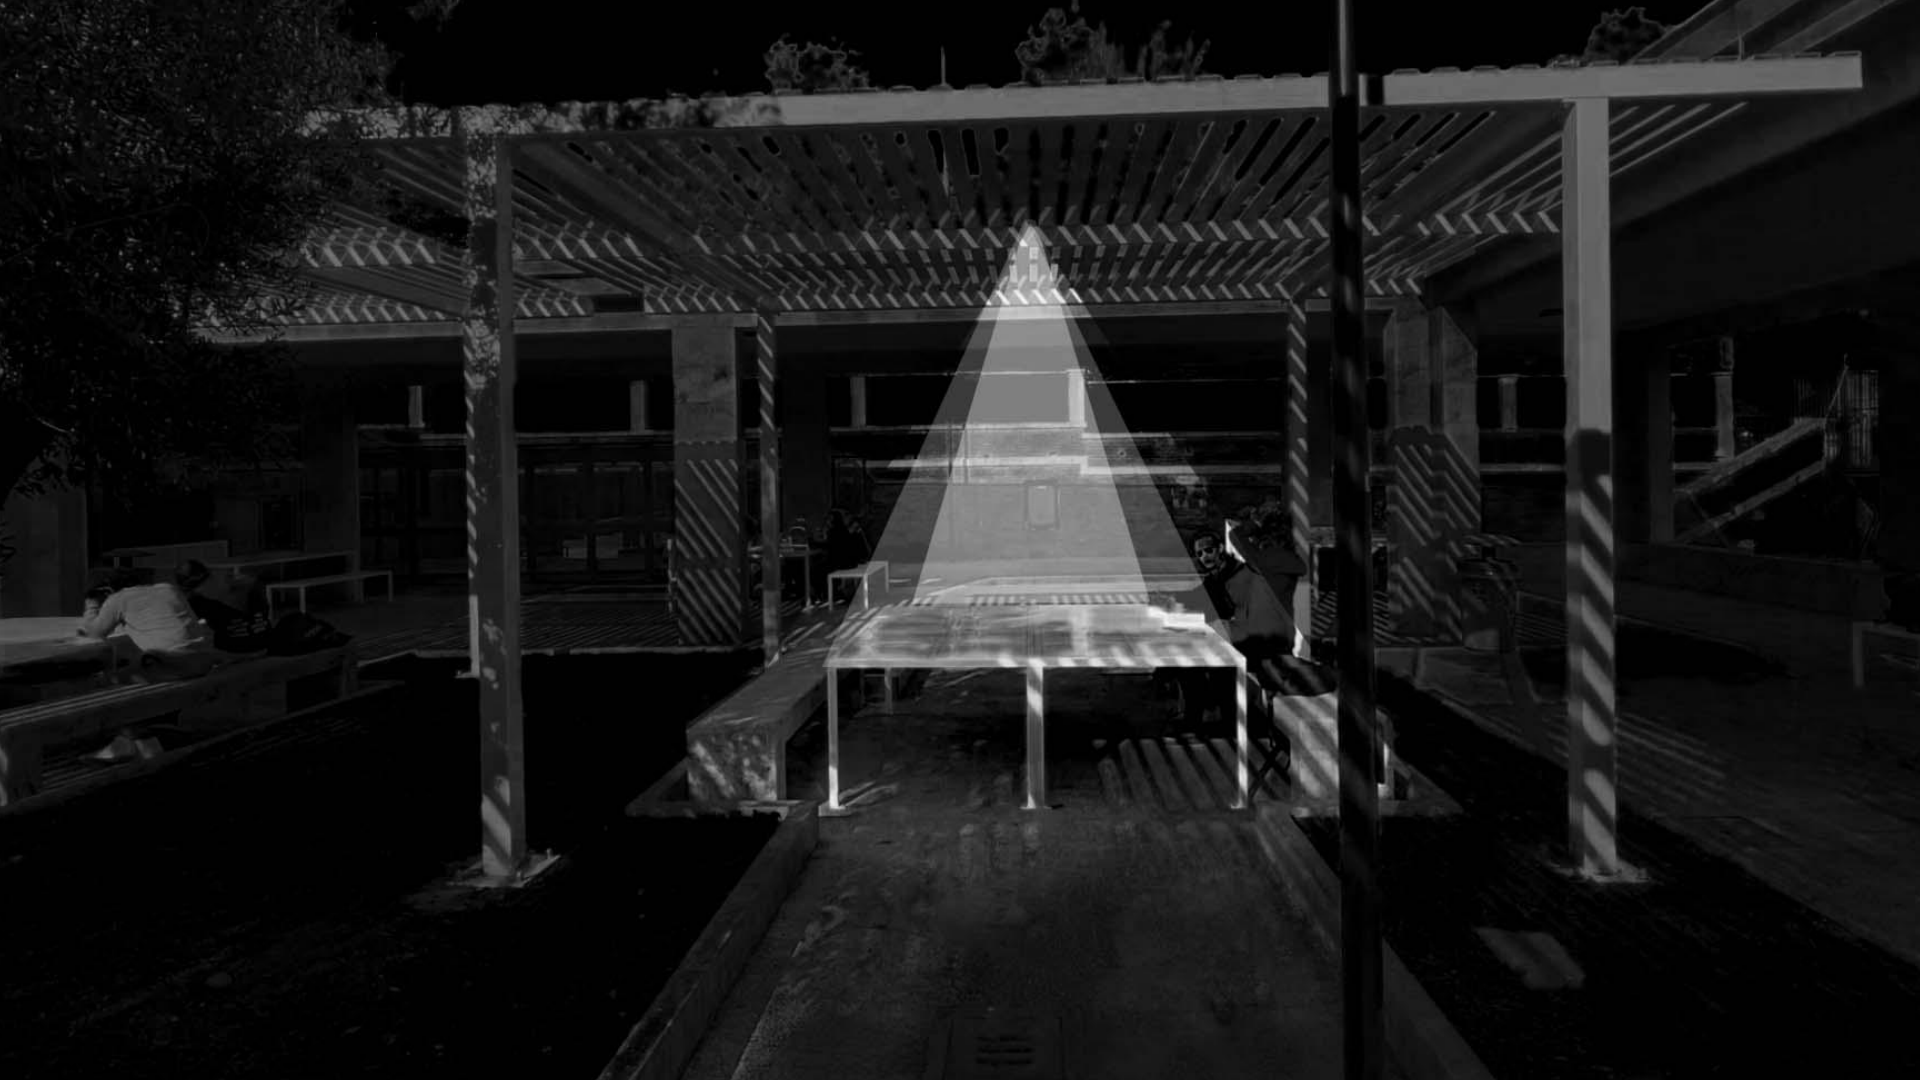

Where this project may establish is exactly in the center of the site, using LED lights and also a PROJECTOR to exhibit the videos in the exact area of the tables where they’ve been scored and transferred to video, giving the feeling of the same activities and moving of the hustle and bustle of students there to the atmosphere, also grabbing the attention of visitors at night.

Thanks for the Attention
